11. TOXICOLOGICAL INFORMATION

11.1 INFORMATION ON TOXICOLOGICAL EFFECTS

	ACUTE EFFECTS	CHRONIC EFFECTS
SKIN CONTACT	With long term contact: drying of skin.	–
EYE CONTACT	May cause short term irritating.	–
INHALATION	–	–
INGESTION	Ingestion of large amounts may cause abdominal pain.	–

ACUTE TOXICITY

Titanium dioxide:

LD₅₀ Oral rat: >100000 mg/kg body weight (no acute toxicity)

Inhalation of large amounts of titanium dioxide dust can reduce lung capacity. It is not known whether this effect is caused by the titanium dioxide itself or if it is a "general" dust effect (A&H 1989:31).

Sodium fluoride:

LD50 Oral rat: 52 mg/kg body weight (poisonous if ingested)

The effect of long term exposure to soluble fluorides is the effect on the bones.

Calculations from the WHO, which are based on the intake of food, indicate that skeletal effects appear at an air condition of 0.8 to 2.0 mg F/m³ for an 8-hour workday. The effect at acute exposure to hydrogen fluoride, fluoric acid and aqueous acid fluoride solutions is irritation of the mucous membranes This was reported in an experimental study on the exposure to HF at 0.7-2.4 mg/m³. The toxicity of the fluoride is not affected by solubility, sparingly soluble fluorides are generally less toxic. Death has been reported after mouth intake of very low doses (approx. 18 mg F/kg) among adults, even lower for children (approx. 4 mg F/kg).

IRRITATION

May cause short term irritating of eyes after direct contact.

CORROSIVITY

No known corrosive effect.

SENSITISATION

No known sensitising effect.

REPEATED DOSE TOXICITY

No known toxicity with repeated dosage.

CARCINOGENICITY

No known carcinogenicity.

MUTAGENICITY

No known mutagenicity.
